Contribution of Mobile Banking Informational Service on Customer Satisfaction in Tanzanian Commercial Banks

James Daniel

Received: 1 January 1970 Accepted: 1 January 1970 Published: 1 January 1970

Abstract

This study examined the contribution of mobile banking Informational Service on customer satisfaction. Three elements of mobile banking i.e., information service was assessed to find out the role they play on customer satisfaction at CRDB Chamwino Branch bank. The study adopted a cross sectional survey study design where data was collected at one point in time. In addition to that, both qualitative as well as quantitative approaches were employed in collecting data for triangulation. Quantitative data was collected from 99 CRDB- Chamwino Branch customers through survey, whereas, the qualitative data were collected from CRDB officials through interviews. Quantitative data was analyzed through SPSS, where, descriptive statistics as well as inferential and Logistic Regression model were used. Furthermore, the relationships between variables were established through binary Logistic Regression. The qualitative data also were analyzed through Thematic Analysis technique. Finding show there is positive significant relationship is also established between mobile banking information service and customer satisfaction with P- Value 0.002. The study concludes that mobile banking enhances customer satisfaction in commercial banks. The study recommends for more efforts to be made in making sure mobile banking technology is enhanced. Also, more investment should be made in making sure that challenges associated with mobile banking technology are minimized.

Index terms— commercial banks, customer satisfaction, informational service, mobile banking, tanzania.

1 I. Introduction

obile banking also recognized as m-banking is a recent innovation in the mobile scientific discoveries. It is a new service delivery channel which followed the already established traditional banking means such as "automated teller machines, telephone, and internet banking" (Amiri & F, 2012) Various terms are used to mean mobile banking comprising "m-banking Kahandawa & Wijayanayake (2014) "branchless banking (Balogun, Ajiboye, & Dunsin, 2013) "m-payments", "m-transfers", "mfinance" Yousuf (2017)and "pocket banking" ??Amin, 2006). These terms associated with mobile banking unambiguously suggest that this innovative service is conducted using a portable or mobile device such as mobile phone or tablet (Sakhaei, Afshari, & Esmaili, 2014). It offers customers an opportunity to cooperate with a bank through a "portable device" (Gomachab, 2016).

Three devices are mentioned to qualify to provide mobile banking service: mobile phone, smart phone, and tablet in a bid to distinguish mobile banking from electronic banking that is accessed through a different user interface, a laptop or desktop PC (Yousuf, 2017). The first mobile banking service was thrown at the end of the 1990s by Pay box in association with Deutsche Bank, both Germany institutions. In the beginning it was introduced and verified in some European nations: Germany itself, United Kingdom, Austria, Spain, and Sweden. In the category of the unindustrialized countries, Kenya took the lead by introducing an m-banking service based on text, M-Pesa ??Workuet al., 2016).

Mobile banking is used to offer a variety of financial and non-financial services. The services offered are divided into transaction and information services. Transaction services includes but not limited to payment of

44 bills (LUKU, TAXES, TV subscriptions), payments between users, transfer of funds, remittances, shopping
45 and contributions, and mobile balance recharge while information services include inquiring balance, brief
46 bank statements, changing PIN, Check book request, due alerts for expenses, and locating ATMs ??Shaikh
47 & Karjaluo, 2015).The introduction of mobile banking technology was meant to offer variety of services to
48 the customers to enhance customer satisfaction. Customer satisfaction (CS) has become essential in marketing
49 originating from the 1960s when it was viewed as "satisfying the needs and desires of the consumer" although the
50 word was already in use in English from the 13th century ??Keith, 1960; ??arker & Mathews, 2001). Customer
51 satisfaction then has become to be viewed in two approaches, first as an outcome of consuming something and
52 secondly as process, which suggests an evaluation of what one received against their expectation ??Parker &
53 Mathews, 2001).

54 The rapidly developing Statistics and Communication Technology (ICT) consumes many changes in the society,
55 including on ways of which service providers communicate to customers. With the technological revolution in this
56 century the world is becoming a village through the process of globalization. At the end of the last century, the
57 Global System for Mobile Communications (GSM) was advanced, this revolutionized on how mobile devices are
58 used ??Hillebrand, 2002; ??ouly, Pautet, & Haug, 1992; ??courias, 1995). With the development of GSM and its
59 improvements, the need for mobile banking in the finance industry arose where users could conduct all financial
60 and non-financial transactions via their mobile devices and reducing the need to physically visit branches. Mobile
61 banking was preceded by web-based banking or internet banking where users accessed their accounts and carried
62 out transactions through banks" web pages.

63 2 II. Literature Reviews a) Kano's Model of Customer Satis- 64 faction

65 In this model, Kano (1984) the model deal deals the least values that clientele expect from a facility or product.,
66 regarding the cost of services, the Kano's model discusses on the attractive requirements of customer satisfaction
67 where the cost of services could be looked as one of them.

68 3 Source: Literature Review, 2022

69 Must-be requirements (Must be): If these desires are not achieved, the consumer will be particularly disappointed.
70 On the other hand, as the client receipts these desires to be settled, their fulfillment which does not increase
71 satisfaction. The must-be requirements are elementary measures of an invention. Satisfying the must-be
72 requirements on individually lead to a stateowned of "unhappy". The client respects the must-be requirements
73 as basics, he receipts them for decided and hence does not openly. Here the bank customers seem to be happy
74 with the mobile banking services although it seems to be happy even before the mobile banking launched at
75 NCBA the customer were happy with the services given at NCBA bank. Hence the Mobile banking adds more
76 satisfaction to customers is now customer transacts at their own remote's areas.

77 4 One-dimensional requirements (Attractive):

78 With respect to these necessities, buyer gratification is comparative to the equal of satisfaction -the advanced the
79 level of self-actualization, the advanced the consumer's gratification and vice versa. Basic provisions are usually
80 openly obligatory from the purchaser. Attractive requirements (indifferent): These desires are the invention
81 dealings which must exciting effect on how fulfilled a client with assumed product. Smart desires are neither
82 apparently stated nor assessed by the purchaser. Sustaining this necessity leads to more than comparative
83 fulfillment. If they are not met, though, there is no sensation of displeasure.

84 In the relation to the subject the Kano model help the use of the categories to measure the levels satisfaction of
85 the customer on the performance, basic, excitement, indifferent and reverse. Kano's model helped on identifying
86 the satisfying customers and the dissatisfying customers through the products or services given by the NCBA
87 bank. Weather its basic to them or performed are the categories for satisfaction.

88 5 b) Disconfirmation Theory

89 Disconfirmation theory developed by Oliver (1977 and 1980) argues that satisfaction is connected to the scope and
90 way of the disconfirmation involvement that happens as a consequence of linking service routine beside prospects.
91 Szymanski and Henard start in the meta-analysis that the disconfirmation model is the best analyst of consumer
92 fulfillment. Ekincietal (2004) cites Oliver's modernized meaning on the disconfirmation model, which shapes
93 "Fulfillment is the guest's self-actualization reaction. It is a decision that an invention or facility feature, or
94 the creation or facility itself, delivered (orisif) an agreeable level of consumption-related gratification, counting
95 heights of below-or over-fulfillment.

96 6 III. Research Methodology

97 To attain this objective qualitative and quantitative research approaches were used whereby survey research
98 design techniques of data compilation method were used. Both primary data and secondary data were involved
99 in the form of interviews, document reviews and survey. Systematic and unsystematic random sampling and

purposive sampling was used as sampling procedures in the study, this study involved Whereby n = Sample size, N = Targeted population, e = Level of precision or confidence interval i.e., 10%. The reasons of adopted 10% and not 5% or 1% is due to the coefficient variation of the population within the researcher interest.

$$7 \quad ?? = 12,670 \frac{1}{1} + 12,670(0.1) \frac{2}{2} = 12,670 \frac{127.7}{1} = \dots$$

8 a) Econometric Model Specification

The study used binary logistic regression model to approximate the chances of the binary variable with two probable result events such as pass/fail, win/lose, high/low as recommended by (Ozsari and Food, 2016). The customer satisfaction is the discrete random variable and dummy scenery that could be measured through binary logistic regression or logit model.

$$9 \quad \dots = 1 \quad \dots = 0 \quad \dots$$

10 IV. Findings and Discussion

Therefore, internal reliability of the 18-item scale was assessed. Results indicated a reliability alpha value of 0.965. This indicates that the internal consistency of items is to the extent of 0.965 out of 1 indicating a very high and reliable consistency of the items. Table 1. indicates the findings.

11 a) Binary Logistic Regressions Analysis

A binary logistic regression analysis was carried out to estimate the logit model. Since the responses of a dependent variable (Customer Satisfaction) had 5-point Likert scale responses; then a cutoff point of was created where all the mean values of 3.5 and above represented customers who are satisfied and were given a value of one.

1. while the rest represented unsatisfied and were assigned a value of zero (0) to make binary logistic regression possible.

12 b) Binary Logistic Regression Goodness of Fit Test

The Hosmer and Lemeshow test were used to run the goodness of fit test for the model. Therefore, the Hosmer & Lemeshow test (Table 2) of the goodness of fit proposes the modelisa good fit to the data as p=0.279 which is greater than 0.1. The study obtained similar findings from interviews, findings of the study revealed that apart from transaction services through mobile money services, the platform also offers information service on whatever is happening from the customer's bank account. Likewise, a customer is able to inquire anything from the account through a mobile phone. One of the respondents commented; "Mobile money doesn't offer transaction services only, it also offers information services; the registered customers are able to see anything happening in their bank accounts; they can also inquire anything they wish to know from their bank accounts at anytime and anywhere without visiting the banking all" (CRDB-Chamwino Branch, January, 2022).

Findings also reveal that customers may inquiry about the balances at their bank accounts, unlike those who are not using mobile banking services where they have to visit the bank. Customers can also get their bank statements through their mobile phones. Other services such as confirmation of receipts and payments are also available through mobile money services. One the respondent responded; "Before the introduction of mobile money services customers had to visit the bank for information from their bank accounts. However, after the introduction of mobile money services, all the information services can be obtained through a mobile phone. Customers may inquire about their bank balances; bank statements and they can confirm various transactions through their mobile phones" (CRDB-Chamwino Branch, January, 2022). "I can check my account balance in any place any time wherever aim especially on salary session without visiting the banking hall."

Findings are not far from other researchers where (Yousuf, 2017) piloted a study on the impact of electronic banking on customers' satisfaction in Ethiopian banking industry (The Case of Clients of Dashen and Wogagen Banks in Gondar City). The study revealed that mobile banking services such as transactions (saving)and information.

According to Khot (2019), whose study address on customer's satisfaction to wards mobile banking services. The Reserve Bank of India has made Mobile banking services accessible to all bank customers regardless of the mobile network. Through mobile banking customers can now add as many receivers in the list as they poverty for fund transfer (Amiri & F, 2012). Also, the investigator found that mobile speculation blackboard is very casual to understand and circle, mobile banking delivers earlier services, it is informal to make broadcast funds, it is informal to make an equilibrium appraisal and less grade of risk in practice of mobile investment group it results. Mobile investment that influences customer gratification the most, as well as smallest making it informal to transact deprived of delays hence limits of time limits.

155 Mobile banking transaction service are found to have a positive effect on the customer satisfaction and therefore
 156 the research establishes that the transaction services provided (convenient funds transfer, bills payment, funds
 157 withdrawal) by mobile banking technology positively contributes to the level of customer satisfaction. It can
 158 also be established that there are convenient transaction services through mobile banking service and positively
 159 enhances the satisfaction of customers ??Balogunet al., 2013).

160 Tanzanian Commercial banks should accommodate customers who frequently wire money transfers across
 161 countries and therefore increase their satisfaction. Consequently, the challenges for mobile banking information
 162 services (such as network problems) should be observed and dealt with so that customers enjoy the services
 perfectly.¹
