Δ

5

The issues of social capital, social cohesion, and social inclusion are increasingly gaining 8 interest in economics, sociology, and politics, mostly in regards to addressing poverty and 9 designing related policies. In this paper, we explain how social inclusion, cohesion and capital 10 differ from each other and different factors that can affect group cohesion as well as benefits. 11 It outlined the understanding of differences between these concepts and how they fit together 12 in individual decision making processes in every organization. In carrying out this study, we 13 had relied upon the use of secondary sources such as journals and other publications. The 14 study found that social inclusion and group cohesion are crucial for the success of any 15 enterprise and concluded that social capital has various social policy functions that relate to 16 bridging, bonding or linking relationships and thus play a critical role in the survival of 17 modern organizations. 18

Review of Social Inclusion, Social Cohesion and Social Capital in Modern Organization

Selma Ndiwakalunga Mulunga ? & Rashad Yazdanifard ? Introduction he main purpose of studying the concepts 23 of social inclusion, social cohesion, and social capital in modern organizations in this research is to examine 24 their theoretical applicability. It had for long been held by most researchers that every organization must 25 focus on productivity and factors empowerment in determining growth and development, which will increase 26 individual recognition that will contribute to their economic growth. Furthermore, recent research had confirmed 27 that working together in a team is a smarter way of enhancing organizational performance and productivity. 28 Introducing the main character in Ellison's classic novel as cited by Oxoby (2009), is a good example of the 29 excluded individual, gifted and talented which he found the door closed to public institution society. This 30 character represents the poor in modern society where he has been excluded from participating in social and 31 32 economic activity, which leads to decreases economic policies. While not necessarily the opposite of exclusion, 33 economic, and social inclusion (generally characterized as a situation in which individuals are integrated into the 34 economic, social, and political framework of society) are increasingly viewed as essential in developing successful 35 growth strategies, fighting poverty, and increasing the well-being of all in an economy.

This paper aims to review the concepts of social inclusion, social cohesion, and social capital in modern organizations as many researchers have turned their attention towards issues such as social capital and social cohesion, trust and trustworthiness, and reciprocal altruism in understanding organizational and national economic performance. Therefore, the paper proceeds with a brief discussion of the chosen keywords and a conclusion is provided to summarize the idea of the whole paper.

II. $\mathbf{2}$ 41

3 Social Inclusion 42

Social inclusion is based on briefs of belonging, acceptance and recognition and entails the realization of full 43 and equal participation in economic, social, cultural and political institutions. It is where everyone being 44 recognizing and valuing diversity; it is about engendering feelings of belonging by increasing social equality 45 and the participation of diverse and disadvantaged populations (Jones, Miller, Pickernell & Packham, 2011). 46 Issues of diversity and social inclusion have an impact on how programs and services are delivered to meet a 47 wide range of client needs. As a result, the concepts of diversity and social inclusion have become critical to 48 the evaluation of programs for governmental and community organizations. Giving all the citizens the right to 49 participate in deciding their present and future is hugely complex and its success depends on the availability of 50 significant resources that are necessary to give cohesion to what naturally may drift in the conflicting directions of 51 self-organization and fragmentation (Bula & Espejo, 2012). This complexity needs practical clarifications where 52 citizens can contribute differently to the creation, regulation and production of social meaning. Social inclusion 53 is the process of improving the dignity, ability and opportunity regardless the basis of the identity to take part 54 in society. Jaghoub (2009) argues that the goal of using information technologies with "marginalized groups" 55 is not to remove the digital divide but rather to further the process of social inclusion. There is no cognitive 56 divide between those who are technologically literate and T It outlined the those that are not as such literacy 57 has different gradations and types. In fact, most people are more interested in engaging themselves in new social 58 practices than in acquiring a specific cognitive skill. 59

As outlined by Wong, Fearon and Philip (2007), social inclusion can be promoted through the development 60 of e-Governance for national good as this can promote concepts such as e-Democracy and e-Community through 61 stakeholder participation and partnership. This will increase the economic well-being of both profit oriented 62 63 and non-profit oriented organizations. Organizations can encourage social inclusion only through participation 64 in organizational development training programs where the employers and their employees need to participate

synchronously (Jones et al, 2011).III. 65

4 Social Cohesion 66

The idea that a society has a certain level of cohesion is an old one that had been approached and understood from 67 a variety of disciplinary traditions. This brings a lot of confusion about what cohesion (Sage, 2013). According 68 to numerous interpretations, social cohesion relates to the social relationships, their importance, proximity and 69 70 strength in society and how these are embedded between individuals, groups and place.

However, academics have tended to divide these relationships into different dimensions (Berman & Phillips, 71 2004; Chan et al., 2007; Oxoby, 2009). According to them, the first dimension is civic norms and values which 72 refer to the trust and support of people for civic and democratic institutions. The second is the "social order 73 and solidarity" this is when there a lack of class conflict and high levels of trust across the society. The third is 74 the "sense of identity" which involves people's attachment to a place, symbolic bond to people, past experiences, 75 ideas and culture. However critics argued that to explore social cohesion deeply, one have to consider both the 76 macro and micro-levels of social relationships. 77

This would be analytically problematic as the above dimension solely focused on the broad, macro-level. For 78 example, Berman and Phillips (2004) have argued that a failure to measure the micro-level of social behavior 79 could limit the conceptual validity of social cohesion. Chan et al. (2007) subsequently argued that the theory of 80 social capital was based upon on the valid definition of social cohesion, which according to Smith and Polanyi 81 (2008) relate to connections among individuals-social networks and norms of reciprocity and trustworthiness that 82 arise from them. Thus, social capital -compared to more traditional notions of social cohesion -is concerned 83 with individual actions and behavior. By putting together the above three dimensions of social capital -the civic 84 participation, associational activity and social networks -into the definition of social cohesion, it becomes possible 85 to capture the quality and cohesiveness of social relationships at different levels of the society. 86

However, Social cohesion has been an enduring subject of inquiry and review for both sociologists and 87 psychologists. Groups are cohesive when they possess group-level structural conditions that produce positive 88 membership attitudes and behaviors and when group members in their interpersonal interactions maintain these 89 group level structural conditions. Social cohesion can affect the academic achievement of a vulnerable student 90 91 whose commitments to schooling is weak and is further compromised by schools with weak social cohesion. Although the definition of social cohesion is difficult to combine or reconcile, it can be defined as the bonds 92 or glue that maintain stability in the society. According to Verhoeven (2008), the possible connections between 93 communications management and social cohesion, social integration and diversity can be explored only by looking 94 at the concept of social capital. Social cohesion consists of reciprocity based on general standards and trust which 95 is the social glue that can either be good or evil (Stovring, 2012). 96

a) Benefits of cohesion 5 97

Group cohesion is crucial in any organization to succeed as it motivates people to work towards the target goals. 98 Daniel (2011) identifies some of the following benefits of cohesion in any organization. In this respect, Rogers 99

(2007) suggests that the cohesion existing in the group determine the extent to which individuals feel that they can suggest new ideas without fear of censure from their colleague. In the same line (Muñoz & Nieto, 2012)

102 consider that the interaction that arise in work group significantly affect the effort that members exert when

103 carrying out their tasks, and serve as a mechanism for increasing the pool of knowledge and skills available in the 104 group, there by facilitating the generation of new knowledge and ideas from member. The benefits of cohesion 105 are as follows:

i. Promotes adherence Recent research had found that most employees adhere to rules and regulations in organisations where there is social cohesion than in organizations where there is no such cohesion.

ii. Fosters cooperation Social cohesion in most cases had led to greater cooperation among employees and thishad ultimately led to improved performance, increased productivity and organizational profit.

110 iii. Encourages better performance Following from the above, group cohesion had inevitably led to synergy

which flows from individuals b) Factors influencing group cohesion As it is posited online by ??uttu (2010, 08:15)

¹¹² identifies the following factors as those that influence the level of group cohesion. According to him, a cohesive ¹¹³ group is one in which all members act toward the achievement of an agreed goal and everyone assumes a position

114 of responsibility with respect to this.

¹¹⁵ 6 i. Status of the group

The status of the group plays a very important role in influencing the level of its cohesion. Thus, a newly formed group will only be loosely cohesive in comparison with another group that that had been in existence for a long time and the members had together weathered the storming stage.

ii. Communication Proximity can also play a very important role in the level of group cohesion. Cohesion
 among members are working in close proximity are usually tight as they are able to resolve issues easily among
 themselves than among those scattered in far-flung distances.

¹²² 7 iii. Location of the group

123 The location of a group can have a serious effect on the level of its cohesiveness. Thus, a group located in a free

124 society where members can express themselves freely could easily attain high level of cohesiveness than a group 125 located in an area where opinions cannot be expressed easily.

¹²⁶ 8 iv. Leadership style

The leadership of a group is one of the major determinants of the level of cohesiveness in any group. In a situation where the leadership of a group is democratic, for instance, the level of cohesiveness will be very high in comparison to another group where the leadership is autocratic.

¹³⁰ 9 v. Management behaviour

The management behaviour has a direct bearing on the level of cohesiveness in a group because the never ending task of management is to make sure that all employees (that is, group members) are keeping to target and deadlines. Thus, the managers must see that there is high level of cohesion among individuals and groups to ensure that they are on target. Failure to do this by the management could be disastrous for an organization as the goals of the organization might not be achieved.

¹³⁶ 10 vi. Socio-economic security

The socio-economic security of group members could be indicative of the level of their cohesiveness because when group members are not socially or economically secure the level of individual member's loyalty to the group might be very low in comparison to groups where members are well off.

IV. The Concept of Social Capital Lee & Tuselmann (2013). Ihlen (2007) stated that social capital is at the heart of public relations as cited by Verhoeven (2008). Modern organizations use social cohesion and integration as link between communications management and public relations. According to Grabner-Kra⁻⁻uter (2009) and Cope et al. (??007) the concept of social capital is widely used in social sciences and can be viewed as an umbrella theory that brings together many related concepts which are: social interaction, trust, and share values which cover the multitude of relationships as cited by Carlos and Pinho (2013).

Parra-Requena, Ruiz-Ortega and Garc?'a-Villaverde (2012) argue that the network of relationships of social 146 147 capital provide an avenue to the agents whereby individuals, firms or communities can explore and obtain benefits 148 from resources placed in these relationships. In their view, social capital is an aspect of social life, network, norms 149 and trust that allow the participants to act together more effectively in order to pursue shared objectives. In 150 other words, it refers to the social connection and the attendant norms and trust. a) Bonding social capital and bridging social capital Bonding social capital refers to the intracommunity ties that members can depend on in 151 situations of need. Such ties can be sources of valuable services, ranging from house mending to job referrals and 152 emergency cash assistance. As cited by Wallis, Killerby, and Dollery (2007), ??ozel and Parker (2000) found that 153 a social group provides essential bonding and bridging social capital in the form of protection, risk management 154 and solidarity functions, especially in the case of poor communities in rural areas. 155

¹⁵⁶ 11 V. Differences Between Social Cohesion and Social Capital

Although these two concepts look similar to each other, there are some important differences between them. 157 Social cohesion refers to the extent of connectedness and solidarity among groups in a society. Jackson, Reino, 158 and Motsmees (2012) outline that Social cohesion has two main broader-intertwined features of society: i. The 159 absence of latent social conflict -essentially all group members are expected to adopt a positive attitude towards 160 each other thus eliminating the possibility of any latent social conflict. ii. The existence of strong social bonds 161 -good faith is required if the group is to meet the challenges posed by its ambivalence about success. Thus, in 162 most cases, the existence of good faith among group members, usually lead to strong social bonds as they could 163 trust each other. 164

165 VI.

166 **12** Discussions

Before we begin it is considerable to define the concept of inclusion, cohesion, and capital. The concept of inclusion has been used as a user-friendly term addressing the manner in which individuals can access resources and institutions to their benefit, although the significant definition has been a problem to define this concept. Arrow (2007), suggest that these terms had been abandoned and that research focus be shifted to studying specific social interactions. Social inclusion is now being promoted only in the use of ICTs as it increases the participation of individual stakeholders and partnership.

173 In terms of economics research, while the literature has explored issues of social capital (Glaeser et al., 2002) and social cohesion (Gradstein & Justman, 2002), there is far less economics research on the issues of inclusion 174 and exclusion. Indeed, this relative paucity of research on inclusion and exclusion is largely due to the lack of 175 clear definitions for these concepts. As discussed by Atkinson (1998), the term social exclusion "seems to have 176 gained currency in part as it has no clear definition which means all things to all people." That said, there does 177 exist (broadly speaking) a general consensus on the meaning of social and economic inclusion/exclusion. Szreter 178 and Woolcock (2004) had attempted to provide an insight into these terms by explaining that while bridging 179 social capital depends on a minimum degree of understanding among the participants in a network, bridging 180 social cohesion is the relationship that spans people and groups of inherent social and economic differences and 181 requires solidarity and cooperation than the more in intimate relationship that are found in the bonding group 182 of family and friends. To them, exclusion is associated with social stigmatization, blame and isolation, which 183 can translate into low selfesteem, a feeling of not belonging and not having been given a chance to be included 184 in society (Curse, Raab, Han & Loenen, 2012). 185

While poverty may be a result of exclusion, exclusion is not only simply mean poverty. For example, exclusion can lead to the abandonment of mainstream norms (Haddadeh & Weerakkody, 2011) and the development of separate subcultures, similarly, exclusion (while potentially leading to non-participation in the labour market; may also manifest itself in withdrawal from social and political life. Thus, the effects and manifestation of exclusion may be highly nuanced. Under the rubric of inclusion, discussions focus on access to (and relative success with) economic, social, and political institutions.

Overall, it is vital for organizations to hire employees with similar educational backgrounds and skills level as group members as they are more likely to feel comfortable among themselves. In this kind of support of social support group, members come together to motivate each other as well as coordinate their gains. Working in a cohesive group also means working with a team which implies that there is a realistic give and take among them; with each member trying to balance his/her needs and wants with those of the other group members.

197 **13 VII.**

198 14 Conclusion

In a nutshell, social inclusion is the process of opportunity enhancement for building or re-establishing social 199 bonds by facilitating the access of all citizens to social activities, income, public institutions, social protection and 200 programs and services for assistance and care. In term of academic contribution to corporate social responsibility, 201 social inclusion should be used to identify the collective responsibility of stakeholders in the promotion of ICTs. 202 This increases the economic wellbeing of all firms and is therefore regarded as fundamental to the development 203 of a nation's status and other societal concepts such as democracy. For this reason, it had been found useful for 204 organizations to hire employees with the same educational levels in order for them to cooperate well with each 205 206 other. Group cohesion at workplace is vital for the success of any business as it promotes personal responsibility. 207 Social cohesion refers to the process of social solidarity that is based on shared values, common norms and 208 common bonds within a national population or community. Social capital is now widely regarded as a resource 209 that can be derived from social relations and harnessed for building durable social cohesion. Besides, it also promotes social inclusion and the empowerment of local communities. 210

Social capital has a various social policy functions that relate to bridging, bonding or linking relationship. It is a flow of individual investments. Groups are cohesive when they possess group level structural conditions that produce positive membership attitudes and behaviors and when group members' interpersonal interactions maintain these group level structural conditions. Social capital is an individual's sacrifices in terms of time, effort, and consumption that were made in an effort to promote cooperation with others. Exclusion is, as a rule,

associated with social stigmatization, blame and isolation, which translates to low self-esteem, a feeling of not

217 belonging and not having been given a chance to be included in the society. Exclusion as a social process is

the denial of access to opportunities and other social rights to an individual. Finally, social inclusion and group cohesion are crucial for the success of an enterprise while social capital has a various social policy functions that

relate to bridging, bonding or linking relationships and thus play a critical role in the long-term survival modern organizations.
