## 6 **Abstract**

7 This primary data based study attempts to explore the factors the investors of capital market  
8 critically consider while making their investment decisions. Study took place in Bangladesh,  
9 an economically potential developing country. A total of 125 investors were surveyed  
10 conveniently with a structured questionnaire containing 25 variables. Broad category of  
11 factors are ?Internal Economic?, ?Internal Supporting?, ?Internal Regulatory?, ?Company  
12 Image?, ?Market Info?, ?External? and ?Market Situation?. Specific variables like dividend,  
13 EPS, company goodwill, industry growth, SEC regulation, and change in Govt. policy are  
14 found to be positively influential. The least influential factors are P/E ratio, price hike of  
15 necessary goods, market rumor etc.

16

---

17 **Index terms**— investor, investment decision, capital market.

## 18 **1 Introduction**

19 Capital market is one of the critical components of any economy. Therefore, investment decision of the investors in  
20 the capital market is very sensitive. Different measures of stock market activities are positively correlated with  
21 measures of real economic growth across countries (Levine and Zervos, 1998). This association is particularly  
22 strong for developing countries. As an economically potential developing country, capital market is certainly a  
23 key factor for Bangladesh. Recent instability in the overall capital market of this country highly enticed the  
24 policymakers. The situation demands to analyze the decision making process of the actors in the capital market.  
25 Thus, this study attempts to explore the key factors those the investors consider while making their investment  
26 decisions in the capital market. The stock market regulatory authority and the policy makers might find the  
27 results helpful in avoiding any unexpected catastrophe, improving the stock market industry and assessing to  
28 which degree the stock market is needed to be reformed.

## 29 **2 II.**

## 30 **3 Methodology**

31 This is a survey based descriptive research. 25 key variables were considered initially. Malhotra (2008) defines  
32 that there should be at least 4 or 5 times as many observations (sample size) as there are variables. Hence, a  
33 total of 125 investors from different brokerage houses of Bangladesh had been surveyed. Investors were chosen  
34 conveniently (non-probability sampling technique). A structured questionnaire was used to collect investors'  
35 responses. The respondents were asked to respond against 25 close ended statements on a 5-point Likert Scale  
36 where '1' denotes 'Strongly Disagree' and '5' denotes 'Strongly Agree'. The key variables were Dividend, Earnings  
37 per Share (EPS), Retained earnings, Price Earning (P/E) Ratio, Returned on Investment (ROI), Company News,  
38 AGM, Company Goodwill, Industry Growth, Price Hike of Necessary Goods, Market Sentiment, Agents ?? III.

## 39 **4 Literature Review**

40 Investors' perception and market behavior are the key concern of the capital market analysts or researchers.  
41 Stock market's contribution on the overall economy of a country is well discussed by different scholars (Singh,

## 5 ANALYSIS & DISCUSSION

---

42 1997; Singh, 1971; ??hide, 1994). Empirical evidence linking stock market development to economic growth has  
43 been inconclusive. Though the balance of evidence is in favor of a positive relationship between stock markets and  
44 economic growth. Levine and Zervos (1998) found that various measures of stock market activities are positively  
45 correlated with measures of real economic growth in different countries and this relationship is particularly  
46 strong in the developing countries. On the contrary, Benson (2002) found this positive impact of capital market  
47 development largely dependent on the inclusion of higher income countries.

48 Movements of stock prices depend on number of factors. The decomposition of stock price movements is  
49 very sensitive to what assumption is made about the presence of permanent changes in either real dividend  
50 growth or excess stock return (Balke & Wohar, 2006). Cochrane (1992) and Timmerman (1995) have argued  
51 that fluctuation in stock prices can be explained by timevarying discount rates and future excess returns. Raihan  
52 & Ullah (2007), from their study on Chittagong Stock Exchange (Bangladesh), found that stock return series  
53 do not follow random walk model in Bangladeshi capital market. Similar findings of the work of ??obarek and  
54 Keasay (2000) on Dhaka Stock Exchange of Bangladesh support this argument.

55 Conducting research in Dhaka Stock Exchange (DSE), Rahman, et al (2006) found the negative correlation  
56 between the beta and stock return, which is reason for inefficiency of market where the assumptions behind the  
57 CAPM model is not supported. Wong, et al (2009) found that when limit hits are imminent stock prices approach  
58 limit bounds at faster rates and with increased volatility and higher trade efficiency.

59 The critical challenge in this field of research is to determine the factors influence the stock price in the  
60 capital market. A large number of empirical studies had been conducted about the determinants of stock prices.  
61 Several researchers examined the relationships between stock prices and selected factors. These factors could be  
62 either internal or external. The findings of their research illustrate different outcomes depending on the scope  
63 of research. Many of these factors could be valid for all stock markets. In this section some of these studies are  
64 reviewed.

65 It is generally assumed that the emerging markets are less efficient than the developed markets. Rahman,  
66 et al (2006) found the negative correlation between the beta and stock return. This is one of the reasons for  
67 inefficiency in the capital market. The movement of stock price is very sensitive to what assumption is made  
68 about the presence of permanent changes in either real dividend growth or excess stock return (Balke & Wohar,  
69 2006). Dividend change announcements cause a greater change in stock price when the nature of the news (good  
70 or bad) goes against the grain of the recent market direction during volatile times (Docking and Koch, 2005).  
71 After using this macroeconomic variables like gross national product (GNP), interest rate and inflation, Al-Qenae  
72 (2002) found inflation and interest rate have negative and statistically significant coefficients in almost all cases  
73 on stock prices while GNP has positive effect. Maysami and Koh (2000) illustrated the connection of money  
74 supply growth, change in short and long term interest rates, inflation and variation in exchange rates with the  
75 changes in Singapore's stock market levels.

76 Udegbunam & Eriki (2001) revealed that stock prices and inflation provides a strong support for the proposition  
77 that inflation exerts a significant negative influence on the behavior of the prices of the stocks. They also exhibited  
78 that stock prices are also strongly driven by the level of economic activity measured by interest rate, GDP, financial  
79 deregulation and money stock. ??oshep and Vezos (2006) proclaim that interest rate and foreign exchange rate  
80 risks are important financial and economic factors affecting the value of common stocks. The results indicate  
81 a significant and negative relation between stock prices and inflation. And the output growth negatively and  
82 significantly affect stock prices. Tsoukalas (2003) used industrial production, exchange rate, consumer prices  
83 and money supply as macroeconomic factors and revealed a strong relationship between stock prices with those  
84 factors. Ibrahim (2003) found that the Malaysian stock price index is positively related to consumer price index,  
85 money supply and industrial production. It is negatively related to the movement of exchange rates.

86 Since consumer price index and investors' perception are two critical issues for the movement of stock prices,  
87 this study aims to explore the factors those are valued by the capital market investors.

88 IV.

## 89 5 Analysis & Discussion

90 25 initial variables were chosen to identify the factors affecting investment decisions in the stock market. A total  
91 of 125 investors were surveyed. Summary of their responses toward those factors are portrayed here. The above  
92 responses indicate that there are some factors to which investors are more responsive, like dividend, EPS, company  
93 goodwill, industry growth, SEC regulation, change in government policy etc. The respondents are found to be  
94 less responsive to the factors like P/E ratio; price hike of necessary goods, market rumor etc. But this is their  
95 average result. In contrast, some factors were found which has got two extreme end responses i.e. both strongly  
96 agree and strongly disagree. So it will not to be justified to leave any comment only based upon the mean result.  
97 Here the standard deviation of the response frequency is also depicted. It shows the dispersion of response from  
98 mean. The variance here is showing the responsiveness of mean in relation to standard deviation. The lesser  
99 variance is showing more representative result. Here the result of P/E ratio, ROI, price hike of necessary goods,  
100 agents' advice, market rumor, inflation, Interest rate, International situation etc. are possessing more reliable  
101 result according to variance. For a justified list of influential factors, factor analysis was performed later.

102 Here a mean comparison is done to get the idea about to what extent factors are affecting male and female  
103 investors in their investment decisions. In this study, 106 male and 19 female investors are surveyed. Among

104 them all are not agreed with same factor as a determinant of their investment decision. Here, it is found that the  
105 most important factor to male is 'dividend' whereas it is the 6 th important factor to female investors. Again,  
106 where 'industry growth' is the most important factor to female, it is the 3 rd most important factor for the male  
107 investors. Some of the factors are commonly rated by both the male and female investors. Those are: company  
108 goodwill (2 nd ), law suit file (5 th ), market sentiment (17 th ), price hike of necessary goods (23 rd ) and market  
109 rumor (25 th ). Top and least five determinants for investment for the male are given in the below table: From  
110 the survey, it is noticeable that 'company goodwill' and 'law suit file' are the common determinants among the  
111 top five important factors for both male and female investors, whereas price hike of necessary goods and market  
112 rumor are the common determinants among the least five important factors for both type of investors.

113 This study further conducted 'factor analysis' for data reduction. Factor analysis allows to reduce a large number  
114 of correlated variables to a smaller number of 'super variables'. So, factor analysis was conducted in this study  
115 with the data collected from field survey. For testing appropriateness of the factor model, Bartlett's test is used.  
116 The summary of KMO and Bartlett's Test result is presented here: The Kaiser-Meyer-Olkin (KMO) is a measure  
117 of sampling adequacy. The approximate chi-square statistic is 2067.491 with degree of freedom of 300 at the 0.05  
118 level of significance. The appropriateness of factor analysis requires the KMO statistic to be ranging from 0.5 to  
119 1.0. Here the value of KMO statistic is 0.685. Hence this indicates the appropriateness of factor analysis and also  
120 suggest further investigation. Here Principle Component Analysis (PCA) method is used. The above summary  
121 of "Communalities" shows that the communality (in "Initial" column) for each variable is 1.000.

122 In order to summarize the information contained in the original variables, a smaller number of factors should  
123 be extracted. Eigenvalues approach had been used here for this purpose. This table shows the eigenvalue for  
124 a factor which indicates the total variance explained by each factor. The total variance accounted for all 25  
125 variables is 25.00 which is equal to the number of variable. Here, variable 1 has got a variance of 5.686, which is  
126 (5.686/25) or 22.745% of the total variance. Again like the variable 1, the second variable has got a variance of  
127 3.700, which is (3.700/25) or 14.801% of the total variance and the first two factors has got a cumulative variance  
128 of 37.547%. Only factors with eigenvalue greater than 1.00 are retained and other factors are discarded. An  
129 eigenvalue represents the amount of variance associated with the factors.

130 The following table reveals that the eigenvalue greater than 1.0 (default option) results in seven factors being  
131 extracted. The cumulative percentage of variance testimony the first seven factors to be accounted for 78.684%  
132 of the variance.

133 In this approach, only factors with eigenvalues greater than 1.0 are retained. The other factors are not included  
134 in the model. It indicates the total variance attributed to that factor. Hence, only factors with a variance greater  
135 than 1 are included. Supporting factor. Factor 3 has got a high coefficient with variables V1: Dividend, V7:  
136 AGM, V22: SEC Regulations. This factor can be labeled as internal & regulatory factor. Again factor 4 has  
137 high coefficient for variables V3: Retained earnings, V6: Company News, V8: Company Goodwill. This factor  
138 may be labeled as company image factor. The next factor i.e. factor 5 has got some highly correlated variable  
139 as well. Those are V9: Industry Growth, V15: Market Rumor. Now this factor is labeled as market info factor.  
140 Again the 6 th factor has also got some highly correlated factor. Those are V10: Price Hike of Necessary Goods,  
141 V20: International Situation. Here this factor is labeled as the external factor. And lastly the factor 7 has  
142 also got some highly correlated variables like V11: Market Sentiment, V24: Political Connectivity of Company  
143 Owner. And this factor is labeled as other factor. It can be summarized that investors are being affected in  
144 their investment decision in the major issues related to internal & economic, internal & supporting, internal &  
145 regulatory, company image, market info, external and others.

Extraction Method: Principal Component Analysis

Figure 8: Table 7 :

Extraction Sums of Squared Loadings			
Component	Total	% of Variance	Cumulative %
1	5.686	22.745	22.745
2	3.700	14.801	37.547
3	2.990	11.959	49.506
4	2.191	8.766	58.272
5	1.666	6.666	64.937
6	1.337	5.347	70.285
7	1.100	4.399	74.684

Figure 9: Table 8 :

9

Components	Rotation Sums of Squared Loadings		Cumulative %
	Total	% of Variance	
1	4.519	18.075	18.075
2	3.125	12.501	30.576
3	2.462	9.849	40.425
4	2.373	9.491	49.916
5	2.086	8.345	58.261
6	2.084	8.336	66.597
7	2.022	8.087	74.684

Through the above table, the rotation of sums of squared loading is done. The following table (Table 10) shows the rotated factor matrix.

This matrix represents correlation between the factors and the variables. A coefficient with a large

absolute value indicates that the factor and the variables are closely related.

Here, in this study, Varimax procedure had been used for rotation. Summary of rotated component matrix is presented here

## 146 .1 Global Journal of Management and Business Research

147 Volume XV Issue IV Version I Year ( )

148 Therefore V4 would be selected as surrogate variable under factor 1 since it has the highest factor loading.  
149 V2, V12, V14, V18 have high loading on factor 2 and among the 4 variables V2 has the highest loading. So EPS  
150 (V2) can be selected as the surrogate variable for factor 2. Again among the high loading variables V1, V7, V22  
151 the highest loading is by V1 (Dividend) which in turns becomes the surrogate variable for factor 3.

152 In this way the surrogate variable of factor 4, factor 5, factor 6 and factor 7 is respectively V8 (Company  
153 Goodwill), V15 (Market Rumor), V20 (International Situation) and V11 (Market Sentiment), as those are the  
154 highest loading among the high loadings (Khan, 2006).

155 V.

## 156 .2 Findings And Conclusion

157 Key factors like dividend, EPS, company goodwill, industry growth, SEC regulation and change in government  
158 policy are having higher mean score. At the same time,factors with lower mean score are P/E ratio, price hike of  
159 necessary goods, market rumor etc. The core factors identified through factor analysis through which investors'  
160 investment decision can be affected. This study was conducted based on a developing country's capital market.  
161 The research outcome would be more effective if the study was conducted in a comparative manner with three  
162 different types of economy, i.e. under developed economy, developing economy and developed economy. Yet,  
163 this study is expected to contribute to the researches on capital market behavior. The key investment factors  
164 identified by this research will help the policymakers to their endeavor to reform the capital market.
