Exploring Effective Factors in the Demographic and Motivation Issues of the Banking Sector of Bangladesh

By Mohammad Azizur Rahman

Begum Rokeya University

Abstract- The paper attempted to explore the most effective factors of demographic outlined affecting employees' motivation. With a view to empirical analysis data were collected from 400 bank employees. In the demographic issues gender, age, experience, pay, type and name of the bank, present and prior designations etc. were considered. For inferential statistics there were five regression models with ANOVA and coefficients models developed in the study. The dependent variables were namely work experience, present basic and gross salary, and initial basic and gross salary and 94%, 77%, 68%, 48% and 35% respectively explained by other independent predictors. The study found that work experience was strongly affected by age. On the other hand, present pay (basic and gross) was highly subjective by present designation and initial basic and gross salaries were prejudiced by initial or first joining designation of the employees. The study was also observed on findings that age, present and first joining designations modify employees' motivation in the banking sector of Bangladesh (showed in Table 18).

Keywords: age, gender, work experience, initial salary, gross salary, motivation.

Exploring Effective Factors in the Demographic and Motivation Issues of the Banking Sector of Bangladesh

Mohammad Azizur Rahman

Abstract- The paper attempted to explore the most effective factors of demographic outlined affecting employees' motivation. With a view to empirical analysis data were collected from 400 bank employees. In the demographic issues gender, age, experience, pay, type and name of the bank, present and prior designations etc. were considered. For inferential statistics there were five regression models with ANOVA and coefficients models developed in the study. The dependent variables were namely work experience, present basic and gross salary, and initial basic and gross salary and 94%, 77%, 68%, 48% and 35% respectively explained by other independent predictors. The study found that work experience was strongly affected by age. On the other hand, present pay (basic and gross) was highly subjective by present designation and initial basic and gross salaries were prejudiced by initial or first joining designation of the employees. The study was also observed on findings that age, present and first joining designations modify employees' motivation in the banking sector of Bangladesh (showed in Table 18).

Keywords: age, gender, work experience, initial salary, gross salary, motivation.

1. INTRODUCTION AND REVIEW CONTEXT

Human Resource Management (HRM) is regarded as the significant department for talent management. The talented employees compulsorily considered as assets in the organization which can be effective through acquisition, development, motivation and maintenance integrated from all units of the bank. HRD selects the right kind of personnel for the committed posts. In addition to this, HRD maintains talent human resources for the bank by applying various motivational techniques and HRs considered as soft assets (www.ventureline.com). Since bank is a service industry, this is why, its sustainability and competitive opportunities depends on how HR Department utilize their potentialities and competencies. The need of talent employees is well recognized in all events of global financial crisis (2007-2008) that was mostly connected with ambitious and ineffectual investment decision by the banks (Islam et al, 2017). Bangladesh Bank (BB) and Ministry of Finance (MoF) emphasized to ensure better HRM in the banking sector of Bangladesh through circulars (BB & MoF, 2015). The

circulars are associated with rules and regulations, maintaining banking hours, salaries and incentives, leave and performance appraisal of female employees.

Motivation means inspiring people to work continuation. Motivated employees do have best quality of performance. Employees' motivation is affected by various factors. The total environment of the banking industry has become changed due to face the competitive sustainability. Basic pay, gross pay, designation, promotion, scoring of banking diploma for promotion, experiences, location or posting, types of bank etc. are the issues of demographic factors. Designation and gross pay are highly correlated for motivation.

Different emerging theories of motivation support that age, experience, pay, designation etc. affect the motivation. Work experience relates the holding position through up gradation in the organization. Maslow's need hierarchy theory proves the said issues of demographic (Maslow, 1954). On the other supportive part of the Two-Factor Model namely Hygiene and Motivating factors. Employees can enjoy these factors related to opportunities over a long-term service the organization (Herzberg, 1959, 1987). The Two Factor Theory states that human needs are ordered in a series of levels of the hierarchy accordance to importance which creates motivation. Alderfer's (1969) ERG theory chains Need-Hierarchy and Two-Factor Theory of motivation. Existence (E) chains the basic need and job security, relatedness (R) actually related to social needs and growth (G) is supportive with status and highest level achievement. If a higher order need constants or unfulfilled, an individual can degenerate to lower order needs which cause satisfy easily. McClelland's Three Needs Model (1961) is also supportive to Needs Theory of Maslow whereas it can be seen that need for affiliation (social need), need for power related to ego/status and remaining one that is need for achievement connected to challenging achievement. An employer does have the ability to understand the needs so as to meet these needs having a better chance of involving and retaining talent employees. A survey conducted by Watson Wyatt Worldwide showed that 71% people deliberate money as the main reason to stay as followed by promotion prospect (33%) (Endress, 2007). Abraham Harold Maslow suggested a theory that

Author: PhD Student, IBS, RU & Associate Professor, Management Studies Begum Rokeya University, Rangpur, Bangladesh.
e-mail: azizru07@gmail.com

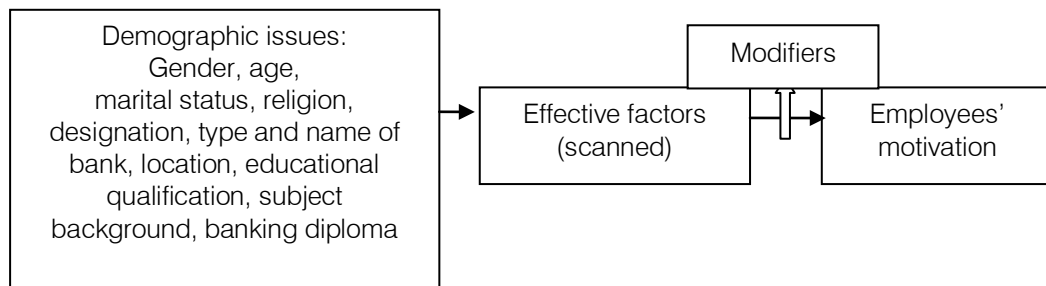

delineated five hierarchical needs which could also be functional to an organization and its employees' performance (Gordon, 1965). Without one of the lower ones the second need could be achieved or satisfied. Maslow's needs theory is static imperative and applicable in today's business organizations, for every organization that seek to obtain success and excellence reflects positively the organizational culture, HRM and the employee's productivity, to attain organizational excellence and create good environment, better and enjoyable work environment and achieve goal at the right time then a effort and application of the theory is supreme (Jerome, 2013). When an organization tries to know what drives personnel to work more, it is in a better position to influence them to perform well (Kovach, 1987). Again it clarifies that employees performance can be examined by three indicators namely ability, workplace environment, and motivation (Griffin, 1990). It is critical job for the managers in terms of motivating subordinates since it is noticed that there globally changes in demographic factors, as well as highly advanced technology (Wiley, 1997). This only emphasized the need to explore what motivates employees in order to get better performance. The author highlighted the most and less important factors of motivation in workplace from the earlier management. The most important factors in 1946 (appreciation), 1980

(interesting work), 1986 (interesting work) and 1992 (good wages) and less important factors were in 1946 (discipline), 1980 (discipline), 1986 (personal problems), and 1992 (personal problems). The study received the most striking findings that money and job security are the clear indicators of motivation. The effective pay program, a primary motivating factor is critical due to individuals and psychological possessions. It is does have immaterial value of the reward, but the increase in self-regard that public recognition accompanying with monetary compensation affords (Dawson and Dawson, 1990). In the past, huge numbers of research studies on employee motivation in the different perspectives already conducted. Very few of them were conducted relating to demographic composition with motivation. The present paper stressed to observe the influential factors of motivation with the sources variables of demographic issues among the employees in the sampled banks. The study also designed to explore the most effective factors in motivation.

Research questions: Does demographic composition affect employee motivation in the banking sector?

Objective of the study: The main objective of the study was to scan effective factors in demographic and motivating focuses among the employees of the banking sector in Bangladesh.

II. RESEARCH FRAMEWORK

Hypotheses

Alternative hypotheses (H_a)

- H_{a1} Employee motivation is related to work experience in the sampled banks.
- H_{a2} There is a positive relationship between employee motivation and present basic salary
- H_{a3} Present gross salary affects employee motivation in the banking sector.
- H_{a4} Initial basic salary motivates employees positively.
- H_{a5} Initial gross salary motivates employee positively.

III. METHODOLOGY

The study has been designed based on empirical and quantitative materials. The employees who were in the service full time in the banks considered as participants. The primary data were collected during

March-June 2019 from 400 employees (320 employees of four public and remaining 80 employees of six private banks operated in the Northern three districts of Rangpur Division Bangladesh through sample random sampling (SRS). Data have been analyzed by SPSS IBM Version 22.0. Secondary data were collected from different research articles, published and unpublished books, dailies and websites.

IV. RESULTS AND DISCUSSION

Table 1: Demographic outline of the respondents (source: Field survey, up to June 2019)

Demographic issues		Percent	Mean	SD	CV
Sex	Male	83.5	1.165	0.372	31.93%
	Female	16.5			
Age group	< 30-40 years	59.5	2.633	0.922	35%
	41-50 years	13.8			
	> 50 years	26.8			
Marital status	Married	99.0	1.010	0.100	9.86%
	Single	1.0			
Religion	Islam	89.3	1.110	0.321	18.94%
	Hindu	10.75			
Type of bank	Public	80.0	1.200	0.401	33.38%
	Private	20.0			
Location (District)	Rangpur	41.5	1.743	0.712	40.88%
	Dinajpur	42.8			
	Nilphamari	15.8			
Educational Qualification	Bachelor	17	2.660	0.749	28.15%
	Master	83

	>20000-30000/-	3.5			
Initial Gross Pay (Tk.)	<20000-40000/-	98.8	13401	16433	122.63%
	40000-60000/- (more)	1.2			

Regression Models (Table 2, 5, 8, 11, & 14)

Table 2: Regression: Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Err. of Estimates	Change Statistics				
					R ² Change	F	df1	df2	Sig. F
1	0.971 ^a	0.942	0.940	2.741	0.94	483.94	13	386	0.000

a. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla).

b. Dependent Variable: Working experience (year).

Remarks: The fitted linear regression model for working experience (year) and other independent variables listed. The model is good fit for this dataset and the coefficient of multiple determinations R^2 is 0.942 (Table

2). Since the $R^2 \sim 0.94$ then the dependent variable *work experience* 94% explained by the independent variables/predictors.

Table 3: ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	47261.760	13	3635.520	483.944	0.000 ^b
	Residual	2899.737	386	7.512		
	Total	50161.498	399			
a. Dependent Variable: Working experience (year)						
b. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla).						

Hypothesis: The null hypothesis, $H_0: B_0 = B_1 = B_2 = \dots = B_{13} = 0$

The alternative hypothesis, $H_1: B_0 = B_1 = B_2 = \dots = B_{13} \neq 0$

Remarks: From the Table 3 ANOVA table the fitted regression model F-test statistic value is 483.944 and the significance value (p value) 0.000 which is less than 0.05 (p value < α). Then all the regression coefficients

were statistically highly significant at 5% level of significance. That is the null hypothesis is rejected and alternative hypothesis is accepted. Therefore, all the regression coefficients were not zero (0).

Table 4: Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant: Experience)	-16.110 (B_0)	2.519		-6.395	0.000
	Gender	0.664 (B_1)	0.402	0.022	1.652	0.099
	Age	0.800 (B_2)	0.034	0.663	23.649	0.000
	Marital status	0.697 (B_3)	1.417	0.006	0.492	0.623
	Religion	-0.535 (B_4)	0.439	-0.015	-1.220	0.223
	Present designation	1.294 (B_5)	0.181	0.152	7.150	0.000
	First joining post	-1.663 (B_6)	0.147	-0.286	-11.334	0.000
	Type of Bank	-0.567 (B_7)	0.636	-0.020	-0.891	0.374
	Name of the Bank	-0.192 (B_8)	0.113	-0.039	-1.697	0.091
	Location (District)	0.341 (B_9)	0.665	0.020	0.512	0.609
	Location (Upazilla)	-0.055 (B_{10})	0.098	-0.023	-0.555	0.579
	Educational qualif.	-0.860 (B_{11})	0.257	-0.057	-3.343	0.001
	Group/ Subject	0.001 (B_{12})	0.206	0.000	0.005	0.996
	Banking Diploma	0.013 (B_{13})	0.223	0.001	0.059	0.953
a. Dependent Variable: Working experience (year).						

The fitted regression model can be defined as,

Workingexperience(year)

$$= -16.110 * (\text{Constant}) + 0.664 * \text{Gender} + 0.800 * \text{Age} + 0.697 * \text{MaritalStatus} - 0.535 * \text{Religion} + 1.294 * \text{Presentdesignation} - 1.663 * \text{Firstjoiningdesignation} - 0.567 * \text{TypeofBank} - 0.192 * \text{NameoftheBank} + 0.341 * \text{Location(District)} - 0.055 * \text{Location(Upazilla)} - 0.860 * \text{Educationalqualification} + 0.001 * \text{GrouporSubject} + 0.013 * \text{BankingDiploma}$$

Remarks: From the fitted (Table 4) the age, present designation, first joining designation, educational qualification were statistically significance at 5% level of significance. Therefore, employees' motivation is exaggerated by the control variable namely age, designation, and educational qualification. The subject

or major discipline does not directly affect motivation (β_{12}) = 0.001 and p value is 0.996. Among the significant independent predictors age (0.800) and present designation (1.294) were positive contribution on the dependent variable *working experience (year)*.

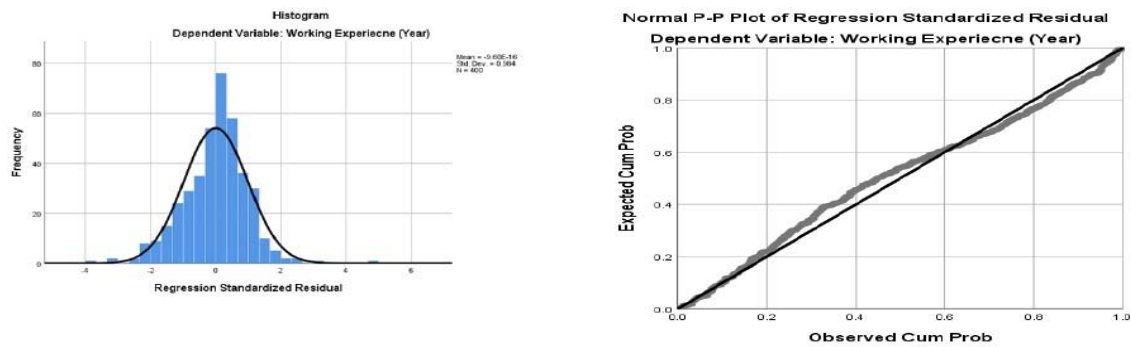

Figure 1 & 2: Histogram and P-P Plot of Regression Standardized Residual (Experience)

Remarks: The Figure 1 & 2 depict that the fitted histogram showed the bell shape curve and Q-Q (quantile-quantile) plot the fitted residual line passing through the origin. Therefore, the dependent variable *working experience (year)* is normally distributed and the linear regression model best fit for this dataset.

Table 5: Regression-Model Summary^b

Model	R	R ²	Adjusted R ²	Std. Err. of the Estimates	Change Statistics				
					R ²	F change	df1	df2	Sig. F
1	0.877 ^a	0.769	0.762	6987.86	0.769	99.1	13	386	0.000

a. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla).

a. Dependent Variable: Present Basic Salary.

Remarks: The above fitted linear regression model (Table 5) for *present basic salary* and other independent variables listed. The model is good fit for this dataset and the coefficient of multiple determinations R² is 0.769. Since the R² ~ 0.769 then the dependent variable *present basic salary* 76.9% or about 77% explained by the independent variables/predictors mentioned above.

Table 6: ANOVA^a

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	62872948092.258	13	4836380622.481	99.045	0.000 ^b
Residual	18848472031.68	386	48830238.424		
Total	81721420123.94	399			

a. Dependent Variable: Present Basic Salary

b. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla).

Hypothesis: The null hypothesis, $H_0: B_0 = B_1 = B_2 = \dots = B_{13} = 0$

The alternative hypothesis, $H_1: B_0 = B_1 = B_2 = \dots = B_{13} \neq 0$

Remarks: From the (Table 6) ANOVA (Analysis of Variance) table the fitted regression model F-test statistic value is 99.045 and the significance value (p value) 0.000. Then all the regression coefficients were statistically strongly significant at 5% level of significance. That is alternative hypothesis is accepted. Therefore, all the regression coefficients were not zero (0).

Table 7: Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Cons: Present basic pay)	-38670.051 (B_0)	6422.814		-6.021	0.000

Group/ Subject	-323.377 (B_{12})	525.967	-0.016	-0.615	0.539
Banking Diploma	878.569 (B_{13})	569.666	0.047	1.542	0.124
a. Dependent Variable: Present Basic Salary (B_0)					

The fitted regression model can be defined as, Model:

Present Basic Salary =

$$-38670.051 * (\text{Constant}) + 554.461 * \text{Gender} + 709.891 * \text{Age} - 5124.611 * \text{MaritalStatus} + 1360.314 * \text{Religion} + 6201.641 * \text{Presentdesignation} + 1902.867 * \text{Firstjoiningdesignation} + 1834.212 * \text{TypeofBank} + 282.551 * \text{NameoftheBank} - 1672.287 * \text{Location(District)} + 74.986 * \text{Location(Upazilla)} + 1623.504 * \text{Educationalqualification} - 323.377 * \text{GrouporSubject} + 878.569 * \text{BankingDiploma}$$

Remarks: From the fitted (Table 7) the age, present designation, first joins designation, educational qualification were statistically significance at 5% level of significance. Among the significant independent

predictors age (709.891), present designation (6201.641) and first joining designation/post (1902.867) were positive contribution to the dependent variable present basic salary.

Figure 3 & 4: Histogram and P-P Plot of Regression Standardized Residual (Present basic salary)

Remarks: From the fitted histogram (Figure 3 & 4) showed the bell shape curve and Q-Q (quantile-quantile) plot the fitted residual line passing through the

origin. Therefore, the dependent variable Present Basic Salary is normally distributed and the linear regression model best fit for this dataset.

Table 8: Regression-Model Summary^b

Model	R	R ²	Adjusted R ²	Std. Err. of the Estimates	Change Statistics				
					R ²	F change	df1	df2	Sig. F
1	0.826 ^a	0.682	0.672	15365.25	0.682	63.742	13	386	0.000
a. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla)									
b. Dependent Variable: Present gross salary									

Remarks: The fitted linear regression model (Table 8) for Present Gross Salary and other independent variables listed above. The model is good fit for this dataset and the coefficient of multiple determinations R² is 0.682.

Since the R² ~ 0.682 then the dependent variable present gross salary 68.2% explained by the independent variables/predictors.

Table 9: ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.

The fitted regression model can be defined as,

Present Gross Salary

$$= -76402.124 * (\text{Constant}) + 1172.807 * \text{Gender} + 1244.412 * \text{Age} - 9286.091 * \text{MaritalStatus} + 1028.259 * \text{Religion} + 10226.033 * \text{PresentDesignation} + 3129.422 * \text{Firstjoiningdesignation} + 15523.420 * \text{TypeofBank} + 420.502 * \text{NameoftheBank} - 4565.112 * \text{Location(District)} + 326.900 * \text{Location(Upazilla)} + 2791.159 * \text{EducationalQualification} - 282.423 * \text{GrouporSubject} + 1700.733 * \text{BankingDiploma}$$

Remarks: From the (Table 10) fitted the age, present designation, first joins designation, educational qualification were statistically significance at 5% level of significance. Among the significant independent predictors age (1244.412), present designation (10226.033), first joining designation/post (3129.422) and type of bank (15523.420) were positive contribution to the dependent variable Present Gross Salary. Therefore, there is a strong association among age, present designation, joining post and type of bank that affect employee satisfaction.

Figure 5 & 6: Histogram and P-P Plot of Regression Standardized Residual (Present gross salary)

Remarks: From the fitted histogram (Figure 5 & 6) showed the bell shape curve and Q-Q (quantile-quantile) plot the fitted residual line passing through the origin. Therefore, the dependent variable *Present Gross Salary* is normally distributed and the linear regression model best fit for this dataset.

Table 11: Regression-Model Summary^b

Model	R	R ²	Adjusted R ²	Std. Err. of the Estimates	Change Statistics				
					R ²	F change	df1	df2	Sig. F
1	0.689 ^a	0.475	0.457	5713.00316	0.475	26.857	13	386	0.000
a. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla).									
b. Dependent Variable: Initial basic salary									

Remarks: The fitted linear regression model (Table 11) for *Initial Basic Salary* and other independent variables listed above. The model is fit for this dataset and the coefficient of multiple determinations R^2 is 0.475. Since the $R^2 \sim 0.475$ then the dependent variable *initial basic salary* 47.5% explained by the independent estimators.

Table 12: ANOVA^a

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	11395615319.173	13	876585793.783	26.857	0.000 ^b
Residual	12598424380.577	386	32638405.131		
Total	23994039699.750	399			

a. Dependent Variable: Initial basic salary
b. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla)

Hypothesis: The null hypothesis, $H_0: B_0 = B_1 = B_2 = \dots = B_{13} = 0$

The alternative hypothesis, $H_1: B_0 = B_1 = B_2 = \dots = B_{13} \neq 0$

Remarks: From the ANOVA Table 12 the fitted regression model F-test statistic value is 26.857 and the significance value (p value) 0.000. Then all the regression coefficients were statistically significant at 5% level of significance. That is the null hypothesis is rejected and alternative hypothesis is accepted. Therefore, all the regression coefficients were not zero (0).

Table 13: Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant: Initial Basic Pay)	6234.435	5244.365		1.189	0.235
	Gender	-350.697	838.100	-0.017	-0.418	0.676
	Age	-121.912	71.022	-0.146	-1.717	0.087
	Marital Status	1247.972	2977.753	0.016	0.419	0.675
	Religion	-21.884	918.839	-0.001	-0.024	0.981

Present Designation	-671.561	378.451	-0.114	-1.775	0.077
First joining designation/post	2220.853	308.118	0.551	7.208	0.000
Type of Bank	-1285.682	1402.737	-0.066	-0.917	0.360
Name of the Bank	1064.391	236.772	0.326	4.495	0.000
Location (District)	1761.002	1401.011	0.162	1.257	0.210
Location (Upazilla)	-280.441	206.022	-0.178	-1.361	0.174
Educational Qualification	-879.276	538.907	-0.085	-1.632	0.104
Group/ Subject	-306.230	431.933	-0.027	-0.709	0.479
Banking Diploma	-199.290	462.560	-0.020	-0.431	0.667
a. Dependent Variable: Initial basic salary					

The fitted regression model can be defined as,

Initial basic salary

$$= 6234.435 * (\text{Constant}) - 350.679 * \text{Gender} - 121.912 * \text{Age} + 1247.972 * \text{Marital Status} \\ - 21.884 * \text{Religion} - 671.561 * \text{Present designation} + 2220.583 * \text{First joining designation} \\ - 1285.682 * \text{Type of Bank} + 1064.391 * \text{Name of the Bank} + 1761.002 * \text{Location (Disrtict)} \\ - 280.441 * \text{Location (Upazilla)} - 879.276 * \text{Educational qualification} - 306.230 \\ * \text{Group or Subject} - 199.290 * \text{Banking Diploma}$$

Comment: From the fitted coefficients (Table 13) the, first name of the bank were statistically significance at 5% level of significance. Among the significant independent predictors first joining designation/post

(2220.853) and name of bank (1064.391) were positive contribution to the dependent variable *Initial Basic Salary*.

Figure 7 & 8: Histogram and P-P Plot of Regression Standardized Residual (Initial basic salary)

Remarks: From the Figure 7 & 8 depict that the fitted histogram showed the bell shape curve and Q-Q (quantile-quantile) plot the fitted residual line passing

through the origin. Therefore, the dependent variable *initial basic salary* is normally distributed and the linear regression model best fit for this dataset.

Table 14: Regression-Model Summary^b

Model	R	R ²	Adjusted R ²	Std. Err. of the Estimates	Change Statistics				
					R ²	F change	df1	df2	Sig. F
1	0.592 ^a	0.351	0.329	13459.34450	0.351	16.058	13	386	0.000
a. Predictors: (Constant), Banking Diploma, Group/ Subject, Gender, Religion, Educational Qualification, Marital Status, Location (District), Type of Bank, Present Designation, First joining designation/post, Name of the Bank, Age, Location (Upazilla)									
b. Dependent Variable: Initial gross salary									

Table 15: ANOVA^a

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	37815785084.065	13	2908906544.928	16.058	0.000 ^b

	Name of the Bank	2449.083	556.677	0.337	4.399	0.000
	Location (District)	2369.895	3265.911	0.096	0.726	0.468
	Location (Upazilla)	-360.575	483.174	-0.102	-0.746	0.456
	Educational qualification	-1895.923	1263.673	-0.086	-1.500	0.134
	Group/ Subject	164.586	1013.066	0.007	0.162	0.871
	Banking Diploma	321.652	1097.236	0.015	0.293	0.770

a. Dependent Variable: Initial Gross Salary

From the coefficients Table 16 the study observed that *present designation*, *first joining and name of the bank* were statistically significance at 5% level of significance. Among the significant independent predictors first joining designation/post (4425.217) and name of bank (2449.083) were positively affected the dependent variable *Initial Basic Salary*.

Figure 9 & 10: Histogram and P-P Plot of Regression Standardized Residual (Initial gross pay)

Remarks: From the fitted histogram (Figure 9 & 10) showed the bell shape curve and Q-Q (quantile-quantile) plot the fitted residual line passing through the

origin. Therefore, the dependent variable *initial gross salary* is normally distributed and the linear regression model best fit for this dataset.

Table 17: Results of alternative hypotheses (H_a) from ANOVA Table 3,6,9,12, &16

H_a	Results	Remarks	Relationship/ effect on employee motivation
H_{a1}	$p < 0.05$	Sustained	Employee motivation is related to work experience.
H_{a2}	$p < 0.05$	Sustained	There is a relationship between motivation present basic pay.
H_{a2}	$p < 0.05$	Sustained	Present gross salary affects employee motivation.
H_{a1}	$p < 0.05$	Sustained	Initial gross salary motivates employee positively.
H_{a1}	$p < 0.05$	Sustained	Initial basic salary motivates employees positively.
Therefore, employee motivations affected by all the factors of demographic issues in the banks were accordingly observed.			

Overall it can be explained that employees are in the service of the banking sector influenced by the age, experience, present designation, joining post, type of bank, present and initial gross. There were strong relationships among these control or sources variables in the study. Gender did not affect the satisfaction of

the bank employees. Among these factors the most effective factors were age and present designation (standardized *Beta coefficient value 0.663 and 0.571*). On the other hand, banking diploma mostly affects the promotion in case of public bank.

Table 18: Overall findings from the Table 2&4, 5&7, 8&10, 11&13, 14&16, 17

Dependent variable	R ²	Standardized coefficient	Effective factors	Motivation
Work experience	94%	Age ($\beta=0.663$), present designation ($\beta = 0.152$)	Age	Therefore, motivation is highly associated and modified by demographic effective factors already explored in column 4.
Present basic pay	77%	Present designation ($\beta=0.571$), age ($\beta=0.461$), and first joining designation ($\beta=0.256$)	Present designation	
Present gross pay	68.2%	Present designation ($\beta=0.503$), age ($\beta=0.432$), type of bank ($\beta=0.232$) and first joining designation ($\beta=0.225$)	Present designation	
Initial basic pay	47.5%	First joining designation ($\beta=0.551$), and Name of the bank ($\beta=0.326$)	First joining designation	
Initial gross pay	35.1%	First joining designation ($\beta=0.519$), and Name of the bank ($\beta=0.337$)	First joining designation	

It is evident from the Table 18 work experience is 94% explained by variance whereas age is strongly associated with job experience. Present basic salary 77% is explained by total predictors and it is highly affected by present designation of the existing employees. Present gross salary 68.2% is varied by the estimators and it is mostly influenced by present position of an employee. Initial basic salary is 47.5% ~48% explained by variance and is prejudiced by first joining designation. Initial gross salary 35.1% is explained by total variance and it is strongly affected by employees' first joining designation. Therefore, employees' motivation of the banking sector of Bangladesh is highly associated with work experience, present and initial salaries which are mostly modified by age, present and initial designation. Finally, equation may be Employee Motivation = f (Age + Present designation + Initial designation).

V. CONCLUDING REMARKS

Motivation is a complex to determine its level. The study found from the empirical analysis based on demographic outlined that the most effective factors age, present designation, first joining designation were explored and strongly associated with employee motivation in the banking sector of Bangladesh. Sample area, job experience and pay were considered only which may confine the scope of the study. Lack of huge context of the research is another limitation in the paper. Further study should emphasize in a larger scale of employee perception concentrating on job security and money or pay intrinsically as well as extrinsically.
