## Financial Sector Development And Poverty Reduction

By Hafiz Ghufuran Ali Khan, Abdul Zahid Khan, Arif Ahmad, Dr Awais E Siraj

*International Islamic University Islamabad Pakistan.*

**Abstracts** - Financial sector development is an effective instrument that can bring reduction in poverty. Financial sector can be developed by four different ways, by improving efficiency of the financial sector, by increasing range of financial sector, by improving regulation of the financial sector and by increased accesses of more of the population to the financial services. For estimating effect of financial sector development on poverty we divided financial sector into four sectors, Banking sector, Insurance companies, Stock market and Bond market.  $Gini = f$  (Banking sector, Insurance companies, Stock market and Bond market) For banking sector, we used variables, central bank assets to GDP, deposits money banks assets to GDP, bank deposits, concentration, overhead costs and net interest rate. For insurance company we used variable non life insurance, to capture the effect of stock market variable stock market turnover ratio used. For bond market both market capitalization to GDP and public bond market capitalization to GDP are used. This study attempts to make analysis of the relationship between financial sector development and poverty for different countries. Growth depends on financial sector development and poverty depends on growth, here the negative relation of poverty and financial sector development tested.

## I. INTRODUCTION

Poverty is one of the most prominent problems of the whole world. Numerous measures both at macro and micro level have been taken but it is still a burning issue of not only developing countries but also of the developed world. It hurts productive capacity and there by economic growth of the economy. Financial sector development is an effective instrument that can bring reduction in poverty. Theory and evidence shows that Financial Sector Development can impart on poverty directly, to the extent that it widens access to financial services for the poor, and indirectly through its positive impact on growth, which in return help in

reducing poverty. Financial sector means institutions in the economy, including all wholesale, retail, formal and informal outlets which offers financial services to consumers, businesses and other financial institutions DFID (2004). Financial sector can be developed by four different ways, to improve efficiency of the financial sector, to increase range of financial sector, to improve regulation of the financial sector and to increase accesses of more of the population to the financial services. Financial Sector Development enables the poor to borrow and invest in income enhancing assets. It generates employment, increases income and reduces poverty. It facilitates mobilizing savings for productive investments, both physical and human capital and remittances from abroad. Moreover it reduces transaction costs, helps in improving technological progress which helps in increasing productivity. It can also play an important role in reducing risk and vulnerability and increasing the accessibility of individuals to basic services like health and education.

## II. LITERATURE REVIEW

Functions of financial intermediaries as saving mobilization risk management, acquiring information about investment opportunities, monitor borrowers and facilitating exchange of goods and services help in accumulation of capital and hence increasing rate of technological progress McKinnon (1973) and hence enhancing economic growth Levine (1997). There is a strong linkage between financial sector development and economic growth. Financial sector mobilize resources and allocate it to those investment which generate high return. When the financial sector will be efficient and perform these service better the economic performance will be better and growth will be improve so its ultimate result will be less poverty. By facilitating transaction and providing the credit and other financial product to the poor for getting their basic needs help in reduction of poverty DFID, (2004). Banks also provide loans for education so it leads to human capital formation (De Gregorio, 1996). More investment, more production and more production first increase the growth level then decrease the poverty level, it is indirect impact of banking sector on poverty reduction. According to Hulme. and Mosely (1996) for sustainable development and poverty reduction we need an efficient financial sector development. More information about the investment opportunity, managed

the risk which leads to high expected rate of return. Getting more information for an individual is very costly. But for financial intermediaries it is less costly and these institutions are also expert in investment, if an individual makes investment it will be highly risky and if investment will be made through financial institutions which is less risky and more profitable Gurley and Shaw, (1967); Patrick, (1966); Greenwood and Jovanovic, (1990). For an individual it is difficult to monitor performance of an enterprise. Financial institutions monitor performance of different enterprises on behalf of different investor who makes investment on behalf of these financial institutions. By Monitoring and exerting corporate control, financial institutions can promote growth and improve the capital accumulation Bencivenga and B. Smith (1991) and the ultimate result of it gives poverty reduction. Financial sector can also play role in the form of fast payment services, more branches, improved remittance services in the field of exchange of goods between household and business that reduces transaction cost, thus it can help to promote economic growth.

Financial instability hurt individuals both directly and indirectly. Directly it hurts poor population more as compared to rich, because they are unable to diversify their risk by investing in foreign banks and as they have less power of negotiation Mc Kinnon (1973). Indirectly financial system instability hurt poor by way of growth. Financial instability reduces fund available for investment and therefore it further effect the growth rate. Financial instability also effect real exchange rate because the tradable goods (whose prices are determined by domestic demand and supply) are directly related to credit level (Guillaumont, 2005). Janvry A.D. and E. Sadoulet (2000) using data of twelve countries in Latin America from 1970 to 1994, shows that economic growth depends on financial stability and poverty depends on economic growth, and further added that poor is more vulnerable to cyclical nature of growth as compare to rich and the negative impact of recession is more stronger than the positive impact of expansion on poor. Because the negative effect of growth on poor is generally outweigh the positive effect in raising income level (Deininger and Squire 1966). Economic growth facilitates the migration of funds to its best possible use. Recent literature Kirkpatrick (2000) developed another indirect link between financial development and poverty through Government intervention. Government intervention in the form of financial policies especially credit market policies which favored the borrowers to obtain credit on subsidized rate of interest, it means to adopt the financial liberalization policy (Kirk Patrick 2000). Due to Financial liberalization the economic benefits are trickle down to the lower income group and ultimately reduce the poverty.

Economic growth is necessary for poverty reduction but it must be accompanied by institutional structure and policy environment up to the extent that growth impact the poverty level Lipton and Ravallion, (1955). Economic growth is needed for poverty reduction and it further rely on financial sector development but the linkages of financial sector development and economic growth is not so simple, there is a need of another channel which could be policy intervention and policies which will create an efficient and favorable financial market for capital accumulation and technology innovation Collin Kirkpatrick, (2000).

### III. METHODOLOGY

For estimating effect of financial sector development on poverty we divided financial sector into four sectors, Banking sector, Insurance companies, Stock market and Bond market. Description of this is given below:

Gini = f (Banking sector, Insurance companies, Stock market and Bond market)

For banking sector, we used variables, central bank assets to GDP, deposits money banks assets to GDP, bank deposits, concentration, overhead costs, net interest rate.

For insurance company we used variable non life insurance, to capture the effect of stock market variable stock market turn over ratio used. For bond market both market capitalization to GDP and public bond market capitalization to GDP are used. Following model is prepared for estimation:

$$\text{Gini} = \beta_0 + \beta_1 \text{CBA} + \beta_2 \text{DMB} + \beta_3 \text{BD} + \beta_4 \text{Con} + \beta_5 \text{OC} + \beta_6 \text{NI} + \beta_7 \text{NLI} + \beta_8 \text{SMT} + \beta_9 \text{PBM} + \beta_{10} \text{GBM} + \mu$$

Where as

CBA = Central Bank Assets to GDP

DMB = Deposits Money Bank Assets to GDP

BD = Bank Deposits

Con = Concentration

OC = Overhead Costs

NI = Net Interest rate

NLI = Non Life Insurance pene

SMT = Stock market turnover ratio

PBM = Public bond market capitalization to GDP

GBM = Private bond market capitalization to GDP

### IV. DATA DESCRIPTION

Data on Financial sector variable is taken from Thorsten Beck website <http://econ.worldbank.org/staff/tbeck>. Data on Gini is taken from WIID website <http://www.wiid.gu.se/gini-coefficient>. Due to non availability of time series data we take different years data (unbalanced) for different countries in which.

## V. EMPIRICAL RESULTS

Using Ordinary Least Square (OLS) method, estimated results are presented in the following table.

Dependent variable: Gini Coefficient

Variable	Coefficient	Std. Error	t-Statistic	Prob.
Intercept	40.30504	4.647075	8.673206	0
Central Bank Assets to GDP	-45.02849	14.6766	-3.068047	0.0028
Deposits Money Bank Assets to GDP	-16.00554	9.560759	-1.674087	0.0973
Bank Deposits	-17.06588	9.629179	-1.772309	0.0794
Concentration	61.61029	36.28138	1.698124	0.0926
Overhead Costs	144.9347	48.77275	2.971634	0.0037
Net Interest rate	-15.40079	3.266939	-4.714133	0
Non Life Insurance pene	4.750182	2.566572	1.850789	0.0672
Stock market turnover ratio	-6.916905	2.548054	-2.714584	0.0078
Private bond market capitalization to GDP	-36.46672	6.467128	-5.638781	0
Public bond market capitalization to GDP	6.49047	7.407687	0.87618	0.3831

Table shows that there is negative and highly significant relation between poverty and central bank assets. Coefficient of Deposits Money Bank Assets to GDP is negative.

Coefficient of concentration is positive which means more concentration more poverty. Concentration of banks reduces the number of choices with consumer and it also reduces the number of rivals in banking sector because banks merge in mega banks. So concentration inversely effect growth and its primary impact on consumer is not good (Prager, R. and T. Hannan (1998))

Coefficient of overhead cost is positive which means that as overhead cost increases poverty also increases. For improving the performance of financial institution it is necessary to fairly allocate the overhead cost such as utilities, computer usage, space and supplies, more overhead cost less will be the performance of the financial institution (Rihall, et al., 1994).

Coefficient of interest rate is negative and highly significant. Higher interest rate leads to decrease poverty because more money is distributed among the depositors. A developed financial system is one that has a secure and efficient payment system in the form of interest (Johann Scharler). Stock market turnover ratio is negative. Private bond market capitalization have negative and highly significant effect while that of government bond capitalization has positive but insignificant effect on poverty. The reason for the negative effect of private bond capitalization on poverty is that private sector raises fund through bond market mainly for the expansion of firm which leads more output more employment more income and less poverty. While on the side government uses bonds for raising fund for meeting its deficit which must be repayed along with interest by the consumers in form of taxes. It will adversely effects consumers and leads to more poverty.

## VI. CONCLUSION

This study attempts to make analysis of the relationship between financial sector development and poverty for different countries. Growth depends on financial sector development and poverty depends on growth, here the negative relation of poverty and financial sector development tested. The banking sector variable (CBA, DMB and BD) proved the negative relation of poverty and financial sector development because all the banking sector variables are negative. Like the banking sector stock market variables also show the negative relation and they are highly significant also. In bond market negative relation between public bond market capitalization to GDP and poverty found. With the improvement of the stated variables of banking, stock and bond market poverty decreased. Apart from these there are other variables like concentration and overhead cost. An empirical result shows the positive relation between concentration and overhead cost with poverty. As concentration decreases the number of rival in banking sector because different banks merge with one another and also decreases the choices with the customers, and the increase of overhead cost is also harmful for financial sector development if it is not fairly managed. All these stated factors about concentration and overhead cost hamper the financial development.
