## Abstract

The study focused on the importance of remittances and reserves and also sees its implication for reserve increasing in three countries (Pakistan, India and Bangladesh). We analysis the impact of remittances on reserves in these three countries for the period 2000-2009. The regression analysis shows that remittances effect on reserves positively and significantly. Furthermore the study also finds that remittances have a strong and statistically significant impact on reserve increasing thus the reserves will increase when remittances will increase. The study also finds country wise analysis, Indian country is on top with respect to remittances and reserves and the Indian reserves are heavily dependent on remittances.

## 1 INTRODUCTION

emittance is a transfer of money by a foreign worker to his or her home country. They are private savings of workers and families that are spent to home country for food, clothing and other expenditure. Remittance is not a new phenomenon; it is also a part of the human history. Several European countries, for example Italy, Spain and Ireland were heavily depending on remittances received from their migrants during 19th and 20th centuries.

These countries created policies on remittances after taking some research effort on this field. For instance, Italy was the first country in the world that make a law to protect the remittances in 1901 while Spain was the first country who signed an international treaty with Argentina in 1960 to lower the cost of the remittances received. Remittances are playing very important role in the economies of many countries. According to the World Bank estimates, remittances totaled US\$414 billion in 2009, of which US\$316 billion went to developing countries that involved 192 million migrant workers. Remittances enhance savings, public expenditure on education and growth. Inflows of remittances in any country effect the economic growth very positively, improving the balance of payment position and reducing the dependence on the external growth in number of migrants and their income, lower costs and wider networks in the industry that support remittances. Reserves are very necessary for any Author : ? Head of Research Cell Lahore Business School (University of Lahore), Lahore. Email: iqra4ever@gmail.com Author : ? ? Some of the reserves maintain the commercial banks and remaining reserves maintain the state bank of a country. A country can increase their reserves through remittances because the amount which the people send their home that amount is not fully used some of the amount used and remaining amount submitted to the bank, through tax, foreign aid. Countries keep their reserves in foreign currencies like dollar, Euro; pound because when they import the oil and other different products, they should make the payment in foreign currencies.

## 3 LITERATURE VIEW

Qayyum ??bdullah et al (2008) that study focused on the inflow remittances of Pakistan and its application on economic growth and poverty of Pakistan. They take the data from 1973-2007. The study finds that the remittances have statically significant effect on poverty reduction. So the importance of remittances cannot be denied on in terms of economic growth and poverty reduction. This study also finds that international migration labor have their significant benefit for developing countries. Sunny Kumar Sing et al (2010) they tried to find

45 out the impact of remittances on macroeconomics variables like (GDP, RESERVES, IMPORT and EXPORT).  
46 They take data to analyze from year 1971-2008. The study shows that remittances have been increasing at very  
47 fast level for the last 15 years and these increasing trends can be attributed to various factors like the shifting  
48 from informal channel to formal channel, increase in the volume of international migration due to the economic  
49 improvement of government of India and changes in the regulatory framework regarding international migration.  
50 These increasing in remittances have influenced the foreign exchange reserve of India significantly which have the  
51 potential to affect the many of macro variables. They also find out the remittances has the positive significant  
52 effect on the above variables.

## 53 4 RESEARCH METHODOLOGY

54 The purpose of the study is to evaluate the impact of remittances on reserves. The figure 1

## 55 5 STATISTICAL RESULT AND FINDINGS

### 56 6 Reserves in US\$

### 57 7 Reserves

58 The figure 3 shows that India has the high reserve where as Pakistan and Bangladesh has very low reserves in  
59 their banks. There is a lot of difference in reserves between these three countries. One of the basic reasons of the  
60 high reserves of India is that its population is almost ten times more from both countries.

## 61 8 VI.

## 62 9 REGRESSION ANALYSIS

63 To find out the impact of remittances on reserves we apply regression analysis and create a model for it.

### 64 10 Reserves= ? + β Net remittances

65 Overall Regression Analysis Reserves = -23.34 + 6.73Net Remittances R<sup>2</sup> =0.00 (0.01)

66 The above model shows positive impact on reserves P value is (0.01) which means that remittance have the  
67 significant impact on reserve and the value of R<sup>2</sup> explanatory power is (0.00) which is very good. In above models  
68 Pakistan regression model shows positive impact on reserves, P value is (0.01) which meansthe remittances has  
69 the significant effect on reserves and the value of R<sup>2</sup> Explanatory power is (0.58) which is moderate. The Indian  
70 model shows positive impact on reserves, P value is (0.00) which means the remittances has the statistically  
71 significant effect on reserve and the value of R<sup>2</sup> Explanatory power is (0.90) which is good and the Bangladesh  
72 regression model shows that positive impact on reserves, P value is (0.00) which means the remittances has the  
73 statistically significant effect on reserves and the R<sup>2</sup> Explanatory power is (0.92) which is so good. In three  
74 countries India is one of the best country with respect to remittances and reserves. All three models have the  
75 significant impact on reserves but the Indian reserves are very dependent on remittances.

## 76 11 VII.

## 77 12 CONCLUSION

78 The studies mainly focused on the importance of remittance and reserves and also see the impact of remittances  
79 on reserves. Regression model used to find out the impact of remittances on reserves. It is found that remittances  
80 effect reserves very positively and significantly. Findings from this study are basically, remittances have strong  
81 statistically significant impact on reserves increasing. The finding of this study suggests that if the remittance  
82 will increase, Reserves will also increase. Indian reserves are so much dependent on remittances. <sup>1</sup>
